

## MOS MEMORY INTERFACE

- Dual Positive-Logic NAND TTL-to-MOS Driver
- Versatile Interface Circuit for Use between TTL and High-Current, High-Voltage Systems
- Capable of Driving High-Capacitance Loads
- Compatible with Many Popular MOS RAMs
- VCC2 Supply Voltage Variable over Wide Range to 24 Volts Maximum
- TTL and DTL Compatible Diode-Clamped Inputs
- Operates from Standard Bipolar and MOS Supply Voltages
- High-Speed Switching
- Transient Overdrive Minimizes Power Dissipation
- Low Standby Power Dissipation

(TOP VIEW)

### description

The SN75361A is a monolithic integrated dual TTL-to-MOS driver and interface circuit. The device accepts standard TTL and DTL input signals and provides high-current and high-voltage output levels suitable for driving MOS circuits. Specifically, it may be used to drive address, control, and timing inputs for several types of MOS RAMs including the TMS 1103 and TMS 4062.

The SN75361A operates from the TTL 5-volt supply and the MOS V<sub>SS</sub> supply in many applications. This device has been optimized for operation with V<sub>CC2</sub> supply voltage from 16 volts to 20 volts; however, it is designed so as to be useable over a much wider range of V<sub>CC2</sub>.

The SN75361A is characterized for operation from 0°C to 70°C.

### schematic (each driver)

# TYPE SN75361A DUAL NAND TTL-TO-MOS DRIVER

## absolute maximum ratings over operating free-air temperature range (unless otherwise noted)

Supply voltage range of $V_{CC1}$ (see Note 1)	-0.5 V to 7 V
Supply voltage range of $V_{CC2}$	-0.5 V to 25 V
Input voltage	5.5 V
Inter-input voltage (see Note 2)	5.5 V
Continuous total dissipation at (or below) 25°C free-air temperature (see Note 3):	
JG package	825 mW
P package	1000 mW
Operating free-air temperature range	0°C to 70°C
Storage temperature range	-65°C to 150°C
Lead temperature 1/16 inch from case for 60 seconds: JG package	300°C
Lead temperature 1/16 inch from case for 10 seconds: P package	260°C

- NOTES: 1. Voltage values are with respect to network ground terminal unless otherwise noted.  
 2. This rating applies between the A input of either driver and the common E input.  
 3. For operation above 25°C free-air temperature, refer to Dissipation Derating Curves in the Thermal Information section, which starts on page 19. In the JG package, SN75361A chips are glass-mounted.

## recommended operating conditions

	MIN	NOM	MAX	UNIT
Supply voltage, $V_{CC1}$	4.75	5	5.25	V
Supply voltage, $V_{CC2}$	4.75	20	24	V
Operating free-air temperature, $T_A$	0		70	°C

# TYPE SN75361A

FIGURE 15—USE OF DAMPING RESISTOR TO REDUCE OR ELIMINATE OUTPUT TRANSIENT OVERSHOOT IN CERTAIN SN75361A APPLICATIONS

Applications using SN75361A as interface devices between TTL inputs and the address, control, and timing inputs for three types of MOS RAMs are shown in Figures 12, 13, and 14. A silicon diode is used in Figures 13 and 14 to increase the SN75361A high-level output voltage to obtain the desired high-level input voltage required by these MOS RAMs. An extra power supply could be used in place of the diode.

Figures 12, 13, and 14 show the use of the SN75361A over a wide range of  $V_{CC2}$  supply voltages. The device may even be used as a TTL gate, if desired, by connecting  $V_{CC2}$  to 5 volts.

The fast switching speeds of this device may produce undesirable output transient overshoot because of load or wiring inductance. A small series damping resistor may be used to reduce or eliminate this output transient overshoot. The optimum value of the damping resistor to use depends on the specific load characteristics and switching speed. A typical value would be between  $10 \Omega$  and  $30 \Omega$ . See Figure 15.

## DUAL NAND TTL-TO-MOS DRIVER

### THERMAL INFORMATION

#### power dissipation precautions

Significant power may be dissipated in the SN75361A driver when charging and discharging high-capacitance loads over a wide voltage range at high frequencies. Figure 5 shows the power dissipated in a typical SN75361A as a function of load capacitance and frequency. Average power dissipated by this driver can be broken into three components:

$$P_T(AV) = P_{DC}(AV) + P_C(AV) + P_S(AV)$$

where  $P_{DC}(AV)$  is the steady-state power dissipation with the output high or low,  $P_C(AV)$  is the power level during charging or discharging of the load capacitance, and  $P_S(AV)$  is the power dissipation during switching between the low and high levels. None of these include energy transferred to the load and all are averaged over a full cycle.

The power components per driver channel are:

$$P_{DC}(AV) = \frac{P_L t_L + P_H t_H}{T}$$

$$P_C(AV) \approx C V_C^2 f$$

$$P_S(AV) = \frac{P_{LH} t_{LH} + P_{HL} t_{HL}}{T}$$

FIGURE 16—OUTPUT VOLTAGE WAVEFORM

where the times are as defined in Figure 16.

$P_L$ ,  $P_H$ ,  $P_{LH}$ , and  $P_{HL}$  are the respective instantaneous levels of power dissipation and  $C$  is load capacitance.

The SN75361A is so designed that  $P_S$  is a negligible portion of  $P_T$  in most applications. Except at very high frequencies,  $t_L + t_H \gg t_{LH} + t_{HL}$  so that  $P_S$  can be neglected. Figure 5 for no load demonstrates this point. The power dissipation contributions from both channels are then added together to obtain total device power.

The following example illustrates this power calculation technique. Assume both channels are operating identically with  $C = 200$  pF,  $f = 2$  MHz,  $V_{CC1} = 5$  V,  $V_{CC2} = 20$  V, and duty cycle = 60% outputs high ( $t_H/T = 0.6$ ). Also, assume  $V_{OH} = 19.3$  V,  $V_{OL} = 0.1$  V,  $P_S$  is negligible, and that the current from  $V_{CC2}$  is negligible when the output is high.

On a per-channel basis using data sheet values:

$$P_{DC}(AV) = \left[ (5 \text{ V}) \left( \frac{2 \text{ mA}}{2} \right) + (20 \text{ V}) \left( \frac{0 \text{ mA}}{2} \right) \right] (0.6) + \left[ (5 \text{ V}) \left( \frac{16 \text{ mA}}{2} \right) + (20 \text{ V}) \left( \frac{7 \text{ mA}}{2} \right) \right] (0.4)$$

$$P_{DC}(AV) = 47 \text{ mW per channel}$$

$$P_C(AV) \approx (200 \text{ pF}) (19.2 \text{ V})^2 (2 \text{ MHz})$$

$$P_C(AV) \approx 148 \text{ mW per channel.}$$

For the total device dissipation of the two channels:

$$P_T(AV) \approx 2 (47 + 148)$$

$$P_T(AV) \approx 390 \text{ mW typical for total package.}$$
